

AI Glossary

Algorithm: It is a step by step approach to add inspire and solve problem in a finite time.

Bag of Words (B O W): A model that represents text as a collection of word frequencies ignoring grammar and word order but keeping track of word occurrences.

Control structures: Control structures are set of instructions that controls the flow of instructions in a program.

Contour: A curve joining continuous points in an image that have the same color or intensity.

Data Acquisition: It means collecting raw data from the purpose of reference or analysis for the project.

Modeling: It is the process of designing decision making algorithms that has to be trained on a set of data and apply that learning to recognize certain types of patterns.

Data Visualization: It is an easier way to understand the trends and patterns in data by using graphical presentation tools like charts and graphs.

Flowchart: Flowchart is a graphical representation of an algorithm that makes use of symbols which are connected through arrow to show the direction of the flow of information.

Human Machine Interaction HMI: It can be defined as the communication or interaction between the humans and patients where user interface to perform a specific task or operation.

Lemmatization: Similar to stemming but it reduces words to their base or dictionary form, (example: "better" → "good"), Considering the context

Neural Networks: These are a series of algorithms used to recognize hidden patterns in raw data, posture and classify, it continuously learns and improve.

Python: it is a general-purpose, object oriented, easy to learn, and high-level programming language.

Stemming: A technique used to reduce words to their root brand, (example:" running" → "run"). It helps normalize words for analysis.

Virtual Assist: It is an application that we use to control our smartphone is a prime explanation of AI impacting our daily life.
